*Arachis*

*Leguminosae*

[*Fabaceae/Papilionaceae*]

*Arachis* is made up of Greek *a-* (without) and *rachos* (branch) components and is understood to have been an ancient Greek name for a completely different plant.

Members of this family absorb nitrogen from the air. Through the bacterial nodules on their deep growing roots they will introduce nitrogen to the soil (and aerate it) to the benefit of neighbouring plants and any following them in the same soil.
