*Gliricidia*

*Leguminosae*

[*Fabaceae/Papilionaceae*]

*Gliricidia* is derived from Latin *glis* (dormouse) and *caedo* (kill, cut down, strike, beat) components with reference to maderá's *Gliricidia sepium* rodent killing qualities.

Members of this family *Leguminosae* absorb nitrogen from the air. Through the bacterial nodules on their deep growing roots, they will introduce nitrogen to the soil (and aerate it), to the benefit of neighbouring plants and any following them in the same soil.
