*Trigonella*

*Leguminosae*

[*Fabaceae/Papilionaceae*]

*Trigonella* is a corruption of Latin *trigonum* (three-cornered) itself derived from Greek *tri-* (three) and *-gonia* (angle) components with reference to the triangular shape of the inner protective part of the flower (botanically the corolla).

Members of this family absorb nitrogen from the air. Through the bacterial nodules on their deep growing roots they will introduce nitrogen to the soil (and aerate it) to the benefit of neighbouring plants and any following them in the same soil.
